## Solving program verification problems

- Program verification problems can be encoded to Constraint Horn clauses (CHCs) solving problems

# Programs to CHCs

```
int x=-50;  
int y;  
while (x<0){  
    x=x+y;  
    y=y+1;  
}  
assert(y>0);
```

(Si, et al 2020), Code2inv: A deep learning framework for program verification

## Programs to CHCs

```
int x=-50;  
int y;
```

```
while (x<0){  
  x=x+y;  
  y=y+1;  
}
```

```
assert(y>0);
```

$L(x, y) :- true \wedge x = -50$

## Programs to CHCs

```
int x=-50;  
int y;
```

```
while (x<0){  
  x=x+y;  
  y=y+1;  
}
```

```
assert(y>0);
```

$$L(x, y) \text{ :- } \text{true} \wedge x = -50$$

$$L(x', y') \text{ :- } L(x, y) \wedge x < 0 \wedge y' = y + 1 \wedge x' = x + y$$

## Programs to CHCs

```
int x=-50;
```

```
int y;
```

```
while (x<0){
```

```
  x=x+y;
```

```
  y=y+1;
```

```
}
```

```
assert(y>0);
```

$$L(x, y) \text{ :- } \text{true} \wedge x = -50$$

$$L(x', y') \text{ :- } L(x, y) \wedge x < 0 \wedge y' = y + 1 \wedge x' = x + y$$

$$\text{false} \text{ :- } L(x, y) \wedge x \geq 0 \wedge y \leq 0$$

## Programs to CHCs

```
int x=-50;  
int y;  
while (x<0){  
  x=x+y;  
  y=y+1;  
}  
assert(y>0);
```

$\forall x, y, x', y'$   
 $L(x, y) \text{ :- } \text{true} \wedge x = -50$   
 $L(x', y') \text{ :- } L(x, y) \wedge x < 0 \wedge y' = y + 1 \wedge x' = x + y$   
 $\text{false} \text{ :- } L(x, y) \wedge x \geq 0 \wedge y \leq 0$

# Solving CHCs by counter-example guided abstraction refinement (CEGAR) based model checking

$$\forall x, y, x', y'$$
$$L(x, y) \text{ :- } \text{true} \wedge x = -50$$
$$L(x', y') \text{ :- } L(x, y) \wedge x < 0 \wedge y' = y + 1 \wedge x' = x + y$$
$$\text{false} \text{ :- } L(x, y) \wedge x \geq 0 \wedge y \leq 0$$

## Framework overview

- Extract program features by graph neural networks from CHC's graph representation

## Five proxy tasks from simple to difficult

1. Predict if an graph node is an argument of relation symbol
2. Predict the number of occurrence of the relation symbols in all clauses
3. Predict if a relation symbol is in a cycle
4. Predict the existence of argument bound
5. Predict the clause membership in all/some minimal unsat cores

## Five proxy tasks from simple to difficult

1. Predict if an graph node is an argument of relation symbol
2. Predict the number of occurrence of the relation symbols in all clauses
3. Predict if a relation symbol is in a cycle
4. Predict the existence of argument bound
5. Predict the clause membership in all/some minimal unsat cores

## Five proxy tasks from simple to difficult

1. Predict if an graph node is an argument of relation symbol
2. Predict the number of occurrence of the relation symbols in all clauses
3. Predict if a relation symbol is in a cycle
4. Predict the existence of argument bound
5. Predict the clause membership in all/some minimal unsat cores

## Predict the clause membership in minimal unsat cores

- Simple patterns
  - Clauses close to the assertions are likely in the minimal unsat cores
- Intricate patterns
  - Perfectly predict the clause membership of minimal unsat cores in the case that contain 290 clauses.

# Predict the minimal unsatisfiable cores

- Simple patterns
  - Clauses close to the assertions are likely in the minimal unsatisfiable cores
- Intricate patterns
  - In the verification problem that contain 290 clauses, the model can perfectly predict the clause membership in minimal unsat cores.

## CDHG node definition

**Table 5**

Node types for the CDHG. Note that Tables 2 and 5 use some same node types because they represent the same elements in the CHC. Some abstract nodes, such as *initial* and *guard*, do not have concrete symbol names since they do not directly associate with any element in the CHCs.

| Node types $X^{CDHG}$                          | Explanation                           | Elements in CHCs | Shape                                                                               |
|------------------------------------------------|---------------------------------------|------------------|-------------------------------------------------------------------------------------|
| <i>relation symbol</i> ( <i>rs</i> )           | Relation symbols in head or body      | $L$              |  |
| <i>initial</i>                                 | Initial state                         | $\emptyset$      |  |
| <i>false</i>                                   | <i>false</i> state                    | <i>false</i>     |  |
| <i>relation symbol argument</i> ( <i>rsa</i> ) | Arguments of the relation symbols     | $x, y$           |  |
| <i>variables</i> ( <i>var</i> )                | Free variables                        | $n$              |  |
| <i>operator</i> ( <i>op</i> )                  | Operators over a theory               | $=, +$           |  |
| <i>constant</i> ( <i>c</i> )                   | Constant over a theory                | $0, 1, true$     |  |
| <i>guard</i> ( <i>g</i> )                      | Guard for <i>CFHE</i> and <i>DFHE</i> | $\emptyset$      |  |

## CDHG edge definition

**Table 6**

Edge types for the CDHG.  $rs, rsa, var, op, c, etc.$  are node types from Table 5.

| Edge type $R^{CDHG}$           | Edge arity | Definition                         | Explanation                                                                                                    |
|--------------------------------|------------|------------------------------------|----------------------------------------------------------------------------------------------------------------|
| Control Flow Hyperedge (CFHE)  | Ternary    | $(rs_1, rs_2 \mid false, g, CFHE)$ | Connects the $rs$ node in body and head, and abstract $guard$ node                                             |
| Data Flow Hyperedge (DFHE)     | Ternary    | $(a, op \mid c \mid var, g, DFHE)$ | Connects the root node of right-hand and left-hand side of data flow sub-formulas, and a abstract $guard$ node |
| Guard (Guard)                  | Binary     | $(op \mid c, g, Guard)$            | Connects all roots of ASTs of control flow sub-formulas and the $guard$ node                                   |
| Relation Symbol Argument (RSA) | Binary     | $(a, rs, RSA)$                     | Connects $rsa$ nodes and their $rs$ node                                                                       |
| AST_left ( $A_l$ )             | Binary     | $(op, op \mid var \mid c, A_l)$    | Connects left-hand side element of a binary operator or an element from a unary operator                       |
| AST_right ( $A_r$ )            | Binary     | $(op, op \mid var \mid c, A_r)$    | It connects right-hand side element of a binary operator                                                       |

# CG node definition

**Table 2**

Node types for constraint graph. The shape corresponds to the shape of nodes in Figure 2 and is only used for visualizing the example.

| Node types $X^{CG}$                            | Layer            | Explanation                                   | Elements in CHCs | Shape                                                                               |
|------------------------------------------------|------------------|-----------------------------------------------|------------------|-------------------------------------------------------------------------------------|
| <i>relation symbol</i> ( <i>rs</i> )           | Predicate layer  | Relation symbols in head or body              | $L$              |  |
| <i>false</i>                                   | Predicate layer  | <i>false</i> state                            | <i>false</i>     |  |
| <i>relation symbol argument</i> ( <i>rsa</i> ) | Predicate layer  | Arguments of the relation symbols             | $x, y$           |  |
| <i>clause</i> ( <i>cla</i> )                   | Clause layer     | Represent clause as a abstract node           | $\emptyset$      |  |
| <i>clause head</i> ( <i>ch</i> )               | Clause layer     | Relation symbol in head                       | $L$              |  |
| <i>clause body</i> ( <i>cb</i> )               | Clause layer     | Relation symbol in body                       | $L$              |  |
| <i>clause argument</i> ( <i>ca</i> )           | Clause layer     | Arguments of relation symbol in head and body | $x, y$           |  |
| <i>variable</i> ( <i>var</i> )                 | Constraint layer | Free variables                                | $n$              |  |
| <i>operator</i> ( <i>op</i> )                  | Constraint layer | Operators over a theory                       | $=, -$           |  |
| <i>constant</i> ( <i>c</i> )                   | Constraint layer | Constants over a theory                       | $0, 1, true$     |  |

## CG edge definition

**Table 3**

Edge types for constraint graph. Here,  $rs, rsa, cla$ , etc. are node types described in Table 2. Here, “|” means “or”. For example,  $c \mid op \mid var$  means this node could be node with type  $c$ ,  $op$ , or  $var$ .

| Edge type $R^{CG}$                 | Layer                               | Definition                         | Explanation                                                     |
|------------------------------------|-------------------------------------|------------------------------------|-----------------------------------------------------------------|
| Relation Symbol Argument ( $RSA$ ) | Predicate layer                     | $(rs, rsa, RSA)$                   | Connects relation symbols and their arguments                   |
| Relation Symbol Instance ( $RSI$ ) | Between predicate and clause layer  | $(rs, ch, RSA) \mid (cb, rs, RSA)$ | Connects relation symbols with their head and body              |
| Argument Instance ( $AI$ )         | Between predicate and clause layer  | $(pa, ca, AI)$                     | Connects relation symbols and their arguments                   |
| Clause Head ( $CH$ )               | Clause layer                        | $(cla, ch, CH)$                    | Connect $clause$ node to its head                               |
| Clause Body ( $CB$ )               | Clause layer                        | $(cb, cla, CB)$                    | Connect the $clause$ node to its body                           |
| Clause Argument ( $CA$ )           | Clause layer                        | $(ca, cb, CA) \mid (ch, ca, CA)$   | Connect $ch$ or $cb$ nodes with corresponding $ca$ nodes        |
| Guard ( $GUARD$ )                  | Between clause and constraint layer | $(c \mid op, cla, GUARD)$          | Connect the root node of the AST to corresponding $clause$ node |
| Data ( $DATA$ )                    | Between clause and constraint layer | $(var, ca, DATA)$                  | Connect $ca$ nodes to corresponding $var$ nodes AST             |
| AST sub-term ( $A_{st}$ )          | Constraint layer                    | $(c \mid var \mid op, op, A_{st})$ | Connect nodes within AST                                        |

## Evaluation on five proxy tasks (Task 1 example)

- Task 1: Predict if a node type is relation symbol argument.
- Binary classification task.

## Evaluation on five proxy tasks (Task 1 results)

- Task 1: Predict if a node type is relation symbol argument.

## Motivation

1. Automatic program verification rely on domain-specific heuristics constructed from program features (J. Leroux, et al 2016, Y. Demyanova, et al 2017, V. Tulsian, et al 2014).
2. Deep learning, a popular automatic feature learning technique, has been used to extract program features in many applications (C. Richter, et al 2020, X. Si, et al 2020).
3. More and more studies represent code by graphs and extract program features by GNNs (A. Paliwal, et al 2019, D. Selsam, et al 2019).
4. Every study has unique graph representation and learning models.

## Challenges for learning program features to guide verification

1. The syntax of the source code varies depending on the programming languages, conventions, regulations, and even syntax sugar.
  - We use CHC as input.
2. Program feature extracting requires capturing intricate semantics from long-distance relational information based on re-occurring identifiers.
  - We introduce two graph encoding for CHCs.
3. Most of GNN models cannot deal with hypergraphs.
  - We introduce R-HyGNN, an extension of Relational Graph Convolutional Networks (M. Schlichtkrull, et al 2017).

# Control- and data-flow hypergraph (CDHG)

Horn clause:  $L(x, y, n) \leftarrow L'(x', y', n') \wedge x \neq 0 \wedge x = x' - 1 \wedge y = y' - 1$

Step 1:  $L(x, y, n), L'(x', y', n')$

Step 2:  $x \neq 0$

Step 3:  $L(x, y, n) \leftarrow L(x', y', n') \wedge x \neq 0$

Step 4:  $x = x' - 1 \wedge y = y' - 1$

Step 5:  $L(x, y, n) \leftarrow L'(x', y', n') \wedge x \neq 0 \wedge x = x' - 1 \wedge y = y' - 1$

# Constraint graph (CG)

CHC :  $L(x, y, n) \leftarrow L(x', y', n') \wedge x \neq 0 \wedge x = x' - 1 \wedge y = y' - 1$

Step 1:  $L(x, y, n) \leftarrow L(x', y', n')$

Step 2:  $L(x, y, n) \leftarrow L(x', y', n')$

Step 3:  $x \neq 0 \wedge x = x' - 1 \wedge y = y' - 1$

Step 4:  $L(x, y, n) \leftarrow L(x', y', n') \wedge x \neq 0 \wedge x = x' - 1 \wedge y = y' - 1$

Constraint layer

# R-HyGNN

The updating rule for node representation in time step  $t$ :

$$h_v^t = \text{ReLU}(\sum_{r \in R} \sum_{p \in P_r} \sum_{e \in E_v^{r,p}} W_{r,p}^t \cdot \|[h_u^{t-1} \mid u \in e]),$$

where  $\|\{\cdot\}$  denotes concatenation of all elements in a set,  $r \in R = \{r_i \mid i \in \mathbb{N}\}$  is the set of edge types (relations),  $p \in P_r = \{p_j \mid j \in \mathbb{N}\}$  is the set of node positions under edge type  $r$ ,  $W_{r,p}^t$  denotes learnable parameters when the node is in the  $p$ th position with edge type  $r$ , and  $e \in E_v^{r,p}$  is the set of hyperedges of type  $r$  in the graph in which node  $v$  appears in position  $p$ , where  $e$  is a list of nodes.

# Predict the minimum unsatisfiable cores

- Three minimum unsatisfiable cores

# Predict the minimum unsatisfiable cores

- Predict if a clause occurs in some minimum unsatisfiable cores
